

“State Parliament in Schwerin”, Germany

“VELTINS Arena” in Gelsenkirchen, Germany

“Carnival Liberty” luxury liner, U.S.A

“Golden Terrace and Rondo 1” in Warsaw, Poland

1 "Munich Airport Centre", Germany

2 "Queen Mary 2", England

3 "European Parliament", France

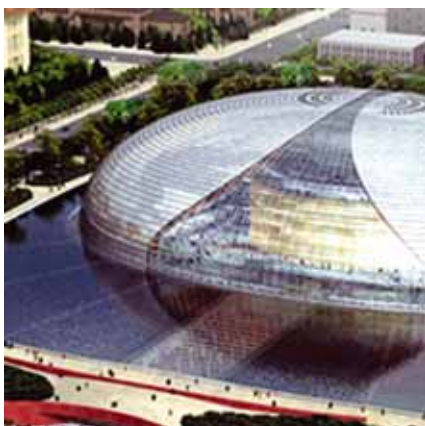

4 "Christ the Saviour Cathedral", Russia

5 "Parliament Buildings", Hungary

6 "International Finance Centre", China

7 "Beijing Opera", China

The Oventrop product range is sold in most countries which is illustrated by project reference all over the world. Here are a few examples:

1 With its spectacular architecture, the service centre of the "Munich Airport Centre" (MAC) is "the" central eye-catcher at the airport. Inside of the building, Oventrop thermostats "Uni LH" and valves of the "Series F" contribute to generate a pleasant room temperature. Especially for the "MAC", the colour of the thermostats was adapted to the radiators and interior decoration.

2 The "Queen Mary 2" is one of the biggest and most expensive passenger liners in the world. Up to 2,620 passengers can be accommodated on board of the luxury liner. The ship uses new electric engine technology. During the voyage, Oventrop double regulating and commissioning valves "Hydrocontrol FR" support the permanent cooling of the electric engines. The bronze flanged valve is suitable for both, salt and domestic water.

3 The "European Parliament" in Strasbourg is a main institution of the European Community. In the assembly halls, Oventrop double regulating and commissioning valves "Hydrocontrol R and F" provide ideal climate conditions. The regulating valves are installed in the supply pipes of the air conditioning units and allow to achieve a hydronic balance between the various circuits of the system.

4 The "Christ the Saviour Cathedral" in Moscow completed in 1881, was blown up in the thirties. After the ruin of the USSR, the reconstruction of the cathedral became the most important project of the orthodox church. For room temperature control, Oventrop supplied the thermostats "Uni LH" as well as isolating valves.

5 The "Parliament Buildings" in Budapest are not only the seat of the Hungarian parliament but also the landmark of the city. The special kind of air conditioning is impressive: Two hidden openings are located under two fountains in front of the building. On hot summer days, these openings serve to supply water-cooled air to the assembly halls. Oventrop valves "Aquastron C and T plus" were installed for the thermal disinfection of the sanitary installation.

6 The "International Finance Centre" is located in the bay of the Central District of Hong Kong and is one of the highest buildings in the world. Oventrop double regulating and commissioning valves were installed in the pipework of the central heating system as well as in the supply pipes of the air conditioning units. They generate a stable and comfortable ambient temperature.

7 The opera in Peking is a glass palace lying in water. The futuristic building has one opera hall and one concert hall as well as two theatres covering an area of 180,000 m². A combined surface cooling and heating system serves to provide a pleasant room temperature. Oventrop supplied the surface heating and cooling system "Cofloor".
